Preface .................................................................................. V

About the Author .................................................................. VII

1 Die Design: Basic Considerations ........................................ 1
  1.1 Die Definition and Purpose ........................................... 1
  1.2 A Spider Supported Die Head ....................................... 3
    1.2.1 Flange Adapter .................................................. 3
    1.2.2 Spider Cone or Torpedo ....................................... 4
    1.2.3 Spider .............................................................. 5
    1.2.4 Connecting Mandrel .......................................... 6
    1.2.5 Connecting Ring ................................................ 7
    1.2.6 Die Clamp or Die-Adjusting Ring ......................... 7
    1.2.7 Die or Bush ...................................................... 8
    1.2.8 Pin or Mandrel .................................................. 9

2 Project Planning ............................................................... 11
  2.1 Data Collection .......................................................... 11
    2.1.1 Product ............................................................ 12
    2.1.2 Product Range ................................................ 13
    2.1.3 Wall Thickness ................................................ 14
  2.2 Material ................................................................. 14
    2.2.1 Rheology Data .................................................. 15
    2.2.2 Thermodynamic Properties ................................. 17
  2.3 Equipment .............................................................. 18
    2.3.1 Extruder ........................................................... 19
    2.3.2 Calibrator ........................................................ 19
    2.3.3 Cooling Bath .................................................... 19
    2.3.4 Haul-off ......................................................... 19
3 Design of a Simple Die ........................................ 23
  3.1 Design Brief ....................................... 23
  3.2 Design of Pin and Die Bush ............................... 24
    3.2.1 Draw Down Ratio .................................. 25
    3.2.2 Draw Down Ratio Balance .......................... 27
    3.2.3 Die Land .......................................... 28
    3.2.4 Convergent Section ............................... 29
  3.3 Relaxation Chamber .................................... 31
  3.4 Spider ............................................. 33
  3.5 Cone or Torpedo ...................................... 37
  3.6 Flange Adapter ....................................... 38
  3.7 Die Clamp Plate ..................................... 39
  3.8 Screw Fixings ....................................... 39
  3.9 Heating of Die ....................................... 41
  3.10 Detailed Drawings .................................... 42
    3.10.1 Die Bush ....................................... 42
    3.10.2 Pin ............................................. 43
    3.10.3 Clamp Plate ..................................... 44
    3.10.4 Connecting Ring .................................. 45
    3.10.5 Connecting Mandrel ............................... 45
    3.10.6 Spider ........................................... 46
    3.10.7 Torpedo or Cone .................................. 47
    3.10.8 Flange Adapter ................................... 48
  3.11 References .......................................... 49

4 Simulation of Melt Flow ................................... 51
  4.1 Experimental Approach ................................ 51
  4.2 Mathematical Calculations of the Flow Characteristics 52
  4.3 Computer Simulation ................................ 59
  4.4 References .......................................... 64
6 Monolayer Die for Tubes ∅1 mm to ∅6 mm .................................. 107
  6.1 ∅1 mm to ∅6 mm Fixed Center in Line Die ........................................... 107
      6.1.1 Design Brief ................................................................. 107
      6.1.2 Draw Down Ratios and Tooling Sizes ............................................. 109
      6.1.3 Design Procedure .................................................................... 109
      6.1.4 Die Simulation (∅2 mm Tube) ...................................................... 112
          6.1.4.1 Die Geometry ................................................................ 112
              6.1.4.1.1 Feed Section ......................................................... 112
              6.1.4.1.2 Distribution Section ............................................. 113
              6.1.4.1.3 Annuli or Tooling Section ...................................... 115
          6.1.4.2 Project Definition .............................................................. 116
              6.1.4.2.1 Material Information ................................................. 116
              6.1.4.2.2 Processing Conditions ................................................ 116
          6.1.4.3 Simulation Results .............................................................. 117
              6.1.4.3.1 Feed Section ............................................................ 117
              6.1.4.3.2 Distribution Section or Spiral Mandrel Part .................. 117
              6.1.4.3.3 Tooling Section (Annuli) ......................................... 118
              6.1.4.3.4 Correction of Tooling Section ..................................... 119
      6.1.5 Die Simulation (∅6 mm Tube) ...................................................... 121
          6.1.5.1 Die Geometry ................................................................ 121
              6.1.5.1.1 Dimensions of Feed Section .................................... 121
              6.1.5.1.2 Dimensions of Distribution Section .......................... 121
              6.1.5.1.3 Dimensions of Tooling Section ............................... 121
          6.1.5.2 Project Definition .............................................................. 122
              6.1.5.2.1 Material Information ................................................. 122
              6.1.5.2.2 Processing Conditions .............................................. 122
          6.1.5.3 Simulation Results .............................................................. 122
              6.1.5.3.1 Feed Section ............................................................ 122
              6.1.5.3.2 Distribution Section or Spiral Mandrel Part .................. 123
              6.1.5.3.3 Tooling Section (Annuli) ......................................... 124

7 Monolayer Die for Tubes ∅4 mm to ∅16 mm ........................................ 127
  7.1 Initial Die Design ............................................................................. 129
      7.1.1 Feed Section ........................................................................... 131
      7.1.2 Distribution or Spiral Mandrel Section ............................................ 132
      7.1.3 Annuli or Tooling Section ........................................................... 133
  7.2 Project Definition ........................................................................... 135
      7.2.1 Material Information ................................................................. 135
      7.2.2 Processing Conditions ............................................................... 135
7.3 Simulation Results .................................................. 136
  7.3.1 Feed Section .................................................. 136
  7.3.2 Distribution Section or Spiral Mandrel ................... 137
  7.3.3 Sections Past the Mandrel ................................. 139

7.4 Ø4.00 mm Tube Die .................................................. 139
  7.4.1 Feed Section .................................................. 141
  7.4.2 Distribution Section or Spiral Mandrel ................... 141
  7.4.3 Sections Past the Mandrel ................................. 142

7.5 Other Materials .................................................... 143
  7.5.1 LDPE ............................................................ 143
    7.5.1.1 Simulation Results of Ø16 mm Tube Die ............ 143
      7.5.1.1.1 Feed Section ...................................... 144
      7.5.1.1.2 Distribution Section or Spiral Mandrel ...... 144
      7.5.1.1.3 Sections Past the Mandrel ...................... 144
    7.5.1.2 Simulation Results of Ø4 mm Tube Die ............ 145
      7.5.1.2.1 Feed Section ...................................... 145
      7.5.1.2.2 Distribution Section or Spiral Mandrel ...... 145
      7.5.1.2.3 Sections Past the Mandrel ...................... 146
  7.5.2 HDPE ............................................................ 147
    7.5.2.1 Simulation Results of Ø16 mm Tube Die ............ 147
      7.5.2.1.1 Feed Section ...................................... 147
      7.5.2.1.2 Distribution Section or Spiral Mandrel ...... 147
      7.5.2.1.3 Sections Past the Mandrel ...................... 148
    7.5.2.2 Simulation Results of Ø4 mm Tube Die ............ 148
      7.5.2.2.1 Feed Section ...................................... 149
      7.5.2.2.2 Distribution Section or Spiral Mandrel ...... 149
      7.5.2.2.3 Sections Past the Mandrel ...................... 149
  7.5.3 Nylon 12 ........................................................ 150
    7.5.3.1 Simulation Results of Ø16 mm Tube Die ............ 151
      7.5.3.1.1 Feed Section ...................................... 151
      7.5.3.1.2 Distribution Section or Spiral Mandrel ...... 151
      7.5.3.1.3 Sections Past the Mandrel ...................... 152
    7.5.3.2 Simulation Results of Ø4 mm Tube Die ............ 152
      7.5.3.2.1 Feed Section ...................................... 152
      7.5.3.2.2 Distribution Section or Spiral Mandrel ...... 153
      7.5.3.2.3 Sections Past the Mandrel ...................... 153
  7.5.4 Flexible PVC .................................................. 154
    7.5.4.1 Simulation Results of Ø16 mm Tube Die ............ 154
      7.5.4.1.1 Typical Flexible PVC (Power Law) ............. 154
      7.5.4.1.2 Typical Flexible PVC (Power Law) – Slip ...... 155
      7.5.4.1.3 Hydro Polymers’ Own Grade .................... 155
7.5.4.1.4 Hydro Polymers XH76214 .................. 156
7.5.4.1.5 Rehau 8426 .................................. 156

7.5.4.2 Simulation Results of ∅16 mm Tube Die .............. 157
7.5.4.2.1 Feed Section .................................. 157
7.5.4.2.2 Distribution Section or Spiral Mandrel .......... 158
7.5.4.2.3 Sections Past the Mandrel ..................... 158

7.5.4.3 Simulation Results of ∅4 mm Tube Die .............. 159
7.5.4.3.1 Feed Section .................................. 159
7.5.4.3.2 Distribution Section or Spiral Mandrel .......... 159
7.5.4.3.3 Sections Past the Mandrel ..................... 160

8 Monolayer Die for Pipes ∅50 mm to ∅125 mm .......... 161

8.1 Design Brief ........................................ 161
8.2 Calculations of Draw Down Ratios for Tool Sizes........ 163
8.3 Initial Die Design ..................................... 165
8.4 Die Geometry ......................................... 168
  8.4.1 Feed Section ..................................... 168
  8.4.2 Distribution or Spiral Mandrel Section ............ 169
  8.4.3 Section above the Spiral Mandrel .................. 170
  8.4.3.1 ∅125 mm × 17 SDR .......................... 170
  8.4.3.2 ∅125 mm × 11 SDR .......................... 172
  8.4.3.3 ∅50 mm × 17 SDR .......................... 173
  8.4.3.4 ∅50 mm × 11 SDR .......................... 174

8.5 Project Definition ..................................... 175
  8.5.1 Material Information ............................ 175
  8.5.2 Processing Conditions ............................ 176

8.6 Simulation Results ................................... 177
  8.6.1 Simulation Results of ∅125 mm × 17 SDR Die ...... 177
    8.6.1.1 Feed Section ................................ 177
    8.6.1.2 Distribution Section or Spiral Mandrel ...... 178
    8.6.1.3 Sections Past the Spirals .................... 180
  8.6.2 Simulation Results of ∅125 mm × 11 SDR Die ...... 181
    8.6.2.1 Feed Section ................................ 181
    8.6.2.2 Distribution Section or Spiral Mandrel ...... 182
    8.6.2.3 Sections Past the Spirals .................... 182
  8.6.3 Simulation Results of ∅50 mm × 17 SDR Die ...... 183
    8.6.3.1 Feed Section ................................ 184
    8.6.3.2 Distribution Section or Spiral Mandrel ...... 184
    8.6.3.3 Sections Past the Spirals .................... 185
8.6.4 Simulation Results of ∅50 mm × 11 SDR Die .......................... 186
  8.6.4.1 Feed Section ........................................... 186
  8.6.4.2 Distribution Section or Spiral Mandrel .................... 187
  8.6.4.3 Sections Past the Spirals .............................. 188
8.6.5 Simulation Results of Other Sizes in the Pipe Range ......... 188

9 Monolayer Die for Pipes ∅140 mm to ∅315 mm ................. 191
  9.1 Design Brief .................................................. 192
  9.2 Calculations of Draw Down Ratios for Tooling Sizes .......... 193
  9.3 Initial Die Design ............................................ 194
  9.4 Die Geometry .................................................. 196
    9.4.1 Feed Section ............................................ 196
    9.4.2 Distributor or Spiral Mandrel Section .................... 197
    9.4.3 Section above the Spirals ................................ 199
      9.4.3.1 ∅315 mm × 26 SDR ................................. 199
      9.4.3.2 ∅315 mm × 17 SDR .................................. 201
      9.4.3.3 ∅250 mm × 17 SDR .................................. 202
      9.4.3.4 ∅140 mm × 17 SDR .................................. 202
      9.4.3.5 ∅225 mm × 11 SDR .................................. 203
      9.4.3.6 ∅140 mm × 11 SDR .................................. 204
  9.5 Project Definition ............................................ 206
    9.5.1 Material Information ..................................... 206
    9.5.2 Processing Conditions ................................... 206
  9.6 Simulation ...................................................... 206
    9.6.1 Simulation Results of ∅315 mm × 26 SDR Die ............ 206
      9.6.1.1 Feed Section ......................................... 207
      9.6.1.2 Distribution Section or Spiral Mandrel ............... 208
      9.6.1.3 Section Past the Spirals or Tooling Section ......... 212
    9.6.2 Simulation Results of ∅315 mm × 17 SDR Die ............ 213
      9.6.2.1 Feed Section ......................................... 213
      9.6.2.2 Distribution Section or Spiral Mandrel ............... 213
      9.6.2.3 Section Past the Spirals or Tooling Section ......... 214
    9.6.3 Simulation Results of ∅250 mm × 17 SDR Die ............ 214
      9.6.3.1 Feed Section ......................................... 215
      9.6.3.2 Distribution Section or Spiral Mandrel ............... 215
      9.6.3.3 Section Past the Spirals or Tooling Section ......... 215
    9.6.4 Simulation Results of ∅140 mm × 17 SDR Die ............ 216
      9.6.4.1 Feed Section ......................................... 216
      9.6.4.2 Distribution Section or Spiral Mandrel ............... 216
      9.6.4.3 Section Past the Spirals or Tooling Section ......... 217
### Contents

9.6.5  Simulation Results of $\varnothing 225$ mm × 11 SDR Die ............................... 217  
9.6.5.1  Feed Section ................................... 217  
9.6.5.2  Distribution Section or Spiral Mandrel ........................................ 218  
9.6.5.3  Section Past the Spirals or Tooling Section ................................. 218  
9.6.6  Simulation Results of $\varnothing 140$ mm × 11 SDR Die .............................. 219  
9.6.6.1  Feed Section ................................... 219  
9.6.6.2  Distribution Section or Spiral Mandrel ........................................ 219  
9.6.6.3  Section Past the Spirals or Tooling Section ................................. 220  

10  Coextrusion Pipe Dies ................................................................. 223  
10.1  Extruded Separately and Then Combined ...................................... 223  
10.2  Extruded Together from One Die .................................................. 225  
10.2.1  Simulation of 2-Layer Interface ................................................ 227  
10.2.1.1  Velocity ........................................................................... 228  
10.2.1.1.1  Overall Velocity Profile ................................................. 228  
10.2.1.1.2  Velocity Profile near the Joining of Two Melt Streams .......... 228  
10.2.1.2  Pressure Drop ................................................................. 231  
10.2.1.3  Temperature .................................................................... 233  
10.2.1.4  Shear Stress ...................................................................... 234  

11  Coextrusion Die ($\varnothing 5.00$ mm to $\varnothing 16.00$ mm) ............................. 237  
11.1  Design Brief ................................................................. 237  
11.2  Product Sizes and Tooling Sizes ................................................... 238  
11.3  Output Calculations for Different Tube Sizes ................................. 240  
11.4  Design of 2-Layer Plus Striping Die for Micro-Duct  
$\varnothing 5.00$ mm to $\varnothing 16.00$ mm ......................................................... 242  
11.4.1  Tooling Section ................................................................. 242  
11.4.2  Distributor Sections .............................................................. 243  
11.4.2.1  Outside Layer Distributor .................................................... 243  
11.4.2.1.1  Outside Layer Die Geometry for Simulation ...................... 244  
11.4.2.1.2  Body, Mandrel, and Spirals Dimensions for Simulation ...... 245  
11.4.2.1.3  Dimensions of Tooling Part from the End of Spiral to the Die End ................................................................. 246  
11.4.2.1.4  Feed Section ................................................................. 246  
11.4.2.1.5  Balancing of Flow through Ports to Spirals ....................... 246  
11.4.2.1.6  Processing Conditions for Outer Layer ............................ 248  
11.4.2.2  Inside Layer Distributor ...................................................... 248  
11.4.2.2.1  Dimensions of Inside Layer Mandrel ............................... 250
11.4.2.2 Dimensions of Section above the Spirals to Pin and Die ........................................ 251
11.4.2.3 Feed Section ........................................... 251
11.4.2.4 Flow from Ring to Spirals ....................... 251
11.4.2.5 Processing Conditions ............................ 252
11.4.2.6 Flow Variables ............................... 252
11.5 Striping ................................................... 253
11.6 Calculation of Number of Bolts Required for Die Head ................................. 256
11.7 Heating of Extrusion Dies ........................................ 260

12 Coextrusion Three-Layer Die (⌀20.00 mm to ⌀65.00 mm) .... 263
12.1 Design Brief .................................................. 263
12.2 Product and Tooling Sizes ................................ 264
12.3 Output Calculations for Different Pipe Sizes .......................... 266
12.4 Design of 3-Layer Pipe Die for Pipes of ⌀20 mm to ⌀65 mm ........ 268
  12.4.1 Tooling Section ........................................ 268
  12.4.2 Distribution Section ..................................... 271
    12.4.2.1 Outside Layer Distributor .......................... 271
    12.4.2.2 Dimensions of Body, Mandrel, and Spirals ...... 274
    12.4.2.3 Dimensions of the Part Past the Spirals ......... 275
    12.4.2.4 Feed Section .................................. 276
    12.4.2.5 Balancing of Flow through Ports to Channels ...... 278
    12.4.2.6 Processing Conditions for Outer Layer .......... 279
    12.4.2.7 Melt Variables Noted from the Software ......... 279
  12.4.3 Design of Second Layer (Middle Layer) ................... 280
    12.4.3.1 Second Layer Distributor .......................... 280
      12.4.3.1.1 Distribution Section .......................... 282
      12.4.3.1.2 Dimensions of Body, Mandrel, and Spirals of Layer 2 ...... 283
      12.4.3.1.3 Dimensions of Section above the Spirals of Second Layer .......... 285
      12.4.3.1.4 Feed Section ............................. 285
      12.4.3.1.5 Dimensions of the Feed Ports of Middle Layer ...... 287
      12.4.3.1.6 Processing Conditions for Middle Layer ...... 288
      12.4.3.1.7 Melt Variables Noted from the Software ......... 288
  12.4.4 Design of Third Layer (Inside Layer) ...................... 289
    12.4.4.1 Third Layer Distributor .......................... 289
      12.4.4.1.1 Dimensions of Body, Mandrel, and Spirals of Layer 3 .......... 292
12.4.4.1.2 Dimensions of Section above the Spirals of Third Layer ........................................ 293
12.4.4.1.3 Feed Section ........................................ 293
12.4.4.1.4 Processing Conditions for Inside Layer ........................................ 294
12.4.4.1.5 Important Melt Variables Obtained from the Software for the Inside Layer of the Die ........................................ 295

13 Three-Layer-Plus-Striping Die for ∅25 mm to ∅110 mm Pipes ........................................ 297
13.1 Design Brief ........................................................................................................ 298
13.2 Product and Tooling Sizes .................................................................................. 298
13.3 Output Calculations for Different Pipe Sizes ..................................................... 300
13.4 Design of 3-Layer Die Head for Pipes ∅25 mm to ∅110 mm .......................... 302
  13.4.1 Tooling Section ......................................................................................... 302
  13.4.2 Body and Main Layer Mandrel ................................................................. 304
  13.4.3 Middle Layer Mandrel ............................................................................. 307
  13.4.4 Inside Layer Mandrel .............................................................................. 309
  13.4.5 Mandrel Extension ................................................................................... 311
  13.4.6 Complete Die ........................................................................................... 313
13.5 Die Simulation .................................................................................................... 314
  13.5.1 Geometry for Simulation of Main Layer .................................................. 315
    13.5.1.1 Dimensions of Feed Section ............................................................ 316
    13.5.1.2 Dimensions of Body, Mandrel, and Spirals ...................................... 316
    13.5.1.3 Dimensions of the Die Part Past the Spirals .................................... 317
    13.5.1.4 Feed Balancing ................................................................................. 317
  13.5.2 Processing Conditions ................................................................................ 320
  13.5.3 Melt Variables Taken from Software ....................................................... 321
  13.5.4 Second Layer .............................................................................................. 322
    13.5.4.1 Geometry for Simulation .................................................................. 322
      13.5.4.1.1 Feed Section ............................................................................... 322
      13.5.4.1.2 Distribution Section ..................................................................... 323
      13.5.4.1.3 Section above the Spirals ............................................................. 324
    13.5.4.2 Processing Conditions ......................................................................... 324
    13.5.4.3 Melt Variables Taken from Simulation ............................................. 325
      13.5.4.3.1 Feed Section ............................................................................... 325
      13.5.4.3.2 Distribution Section ..................................................................... 325
      13.5.4.3.3 Section above the Spirals ............................................................. 325
  13.5.5 Third or Inside Layer .................................................................................. 326
    13.5.5.1 Inside Layer Geometry ...................................................................... 327
    13.5.5.1.2 Body, Mandrel, and Spirals ............................................................ 327

**Index**                                                                 | 341  |
After 50 years of experience in plastics processing, designing, and manufacturing of tools and equipment, in the mid-1990s I got involved in the development of a business for the design and manufacturing of plastics extrusion dies. To develop the business, I needed to convince my customers, with a good reason, that my approach was different to that of anybody else. With this in mind, I searched a lot of literature. I found that there is a lot about the theory of the flow characteristics of molten plastics through the die channels, but there are not any solved examples of the die design. Some of the formulae and equations given in the literature are so complex that most of the practical engineers would find it difficult to solve these equations.

In the computation of the melt flow characteristics through the die channel, there are several influencing factors, such as the rheology data and the thermodynamic properties of the materials involved. Coupled with them are the die geometry and the processing conditions, such as the output requirements and the temperature variations in the melt as well as in the die. The derivatives of these are the pressure loss through the die channel, the velocity profile, the shear rate, the shear stress, etc. Commercially available computer software takes all the hard work of computation from the die design engineers. With the use of such software, die designers can design a die that is fit for its purpose, in terms of materials being used and outputs required for the given sizes of the products.

In this book, I have used the computer simulation software named “Virtual Extrusion Laboratory™, Polymer Processing Simulation Software” by Compuplast International, Inc. Most of the dies given in the book are based on the spiral type of distributor and the reason for using such distributor is also explained in detail. All the dies illustrated in the book have been simulated with the aforesaid software, and the results of the simulations are also given as a guide for the design of other similar dies.

The range of dies covered in the book is monolayer and multilayer tubes and pipes from $\varnothing$ 1 mm to $\varnothing$ 315 mm. Larger or smaller sizes can be designed on the same principles. In the last chapter, the choice of commonly used steels for the manufac-
ture of dies is also discussed. Most of the solved examples of the dies given in this book are used in the manufacturing of specific products and are well proven. The above-mentioned software has been used as a tool for the simulation of the melt flow variables in the dies.

This book has been written as a practical guide for engineers and designers associated with the extrusion processes of polymers for the manufacture of plastic tubes and pipes. As the calculations of the melt flow through the dies are very complex and time consuming, the use of simulation software is highly recommended.

Finally, I thank Dr. Mark Smith and Dr. Julia Diaz-Luque of Hanser for their help and support in the publication of this book.

Sushil Kainth, MBA, B.Sc., CEng, MIET.
1.2 A Spider Supported Die Head

There are several names for this type of die, such as mandrel support die, ring support die, spider supported die, or spider die. The latter is the most commonly used term in the industry and will be employed here throughout this discussion.

This type of die is normally used for extruding PVC or similar types of thermally unstable materials. For other materials that are not so heat sensitive, such as polyolefins (LDPE, HDPE, and PP), polyamides, and many more, a spiral type of distribution is recommended because of its superiority in homogenizing the flow of plastic melt in the die head, as shown in Chapter 5.

In a spider die, a melt stream of plastic from the extruder enters the die head through the breaker plate or connecting ring (not shown in Figure 1.1) into a round channel. The spider cone or torpedo spreads the melt into an annular shape, as shown in Figure 1.1, before it is divided into several sections by the spider legs. Then, these melt sections are joined together by the converging angles of the connecting mandrel (04), the connecting ring (05), the die bush (07), and the mandrel (08). Finally, the melt is forced through a parallel annulus (more commonly known as a die land) between the mandrel and the die.

The term “die head” is used for the complete unit to distinguish it from the die or, as sometimes referred to, the bush. The die or bush is a part of the die head that forms the outside shape of the product to be extruded. To avoid any confusion, the term “die” will be used for the part 07 of the die head and “pin” for the mandrel (08).

The names of the die head parts used here are commonly known in the extrusion industry, and almost everybody involved in plastics processing is familiar with the function of these parts. Nevertheless, a brief description of these parts is given here, and more details are given in Chapter 3.

1.2.1 Flange Adapter

The flange adapter (01 in Figure 1.1) is sometimes known as flange connection and, as the name implies, on one side this part forms a connection to the extruder flange. On the other side it is attached to the spider, which holds the whole die head together. At the extruder end there is a recess to locate on the breaker plate or connecting ring.

The flange part is identical to the extruder flange and both the extruder flange and the flange adapter are clamped together with a clamp not shown in Figure 1.1. The melt from the extruder enters into the flange adapter from the breaker plate in the
form of strands, which are joined together into a round slug. In the case of a spider die head, the slug of melt is spread around the spider cone or torpedo, as shown in Figure 1.1.

The flange adapter normally has a heater and a thermocouple probe fitted to control the temperature of the material in this region. In some cases, a pressure transducer to monitor the pressure in the die head is also incorporated in this part. The design of the flange adapter varies with the design of the other parts of the die and the geometry of the extruder flange to which it is fitted, as can be seen in Chapter 3 and Chapters 5 to 13.

1.2.2 Spider Cone or Torpedo

The spider cone or torpedo (02 in Figure 1.1) is a conical part attached to the inner section of the spider. It is used for dividing the flow of melt from a round slug to an annulus form, which is pushed through the spider channels. The design of this part is discussed in Chapter 3.
1.2.3 Spider

The spider (03 in Figure 1.1) is the heart of this type of die head. It is a bridge between the flange adapter and the connecting ring on the outside, and the torpedo and the mandrel or pin on the inside. More importantly, it divides the melt stream into channels around the spider legs. The melt is again joined by the compression in the connecting ring and the mandrel or pin. The inside and outside annular parts of the spider are kept together by the spider legs, the number of which varies between four and eight depending on the size of the die head. The gap between the outer ring and the inner section—in other words, the channel height—is designed to suit the output required, considering ease of manufacturing and a minimum residence time for the melt. A narrow channel increases the pressure in the die head and is difficult to machine and polish. On the other hand, a large section height increases the residence time and reduces the shear rate, resulting in degradation of the heat sensitive materials in this region. The shape of the spider legs is designed to divide the flow of melt stream and to make it join easily in the chamber between the connecting ring and the pin, as shown in Figure 1.4.
1.2.4 Connecting Mandrel

The connecting mandrel (04 in Figure 1.1) is connected to the inner section of the spider on one end and the pin is connected to it on the other end. The shape and dimensions of this part are dependent upon the shape and dimensions of the other adjoining parts, namely, the inside section of the spider and the diameter of the pin. The lengths of the connecting mandrel and of the corresponding connecting ring are designed to suit the characteristics of the material. These days, a spider die head is very rarely used for processing polyolefin materials like polyethylene and polypropylene. However, there are instances when, for very short runs and for economic reasons, a spider die head is used for processing these materials. In these instances, the lengths of the connecting mandrel and of the connecting ring are made considerably greater, to diffuse the melt disturbance caused by the spider legs and to minimize the flow lines.
3.10 Detailed Drawings

Having gone through the general principles of the spider die design, the detailed drawings prepared for manufacturing all the parts are shown below:

3.10.1 Die Bush

A detailed drawing of the die bush in Figure 3.18 shows all the common dimensions for all the sizes. The dimensions, which vary with each size of the pipe, are listed separately in Table 3.4. It should be noted that the back face of the die bush should be perfectly flat, to provide a good seal against the corresponding face of the outer connecting ring. The inside surface of the die bush should be highly polished and sectional changes should be blended with generous radii.

#### 3.10.2 Pin

A detailed drawing of the pin in Figure 3.19 shows all the common dimensions for all the sizes. The dimensions, which vary with each size of the pipe, are listed separately in Table 3.5. The front end of the pin has a hexagon cut to fit a standard Allen key for tightening the pin to the connecting mandrel. The back face of Ø73.00 mm fits against the corresponding diameter of the mandrel. Also note that generous radii to blend the sections should be used and the outer surface should be highly polished to eliminate the melt sticking to the surface.

![Figure 3.19 Detailed drawing of pin](image)
The principles of designing spiral mandrel dies for tubes and pipes are explained in Chapter 5, where a die for ∅20 mm to ∅50 mm pipe sizes was illustrated as an example. In this chapter, the design of tubes from ∅1 mm to ∅6 mm is given to cover a range of sizes, applications, and materials.

6.1 ∅1 mm to ∅6 mm Fixed Center in Line Die

This die is used for medical tubes made from different types of polymers. As explained in the previous chapters, the starting point of die design is the design brief. Therefore, information about the design scope, product range, materials to be processed, output required, size of the extruder, etc. is collected as a starting point. After collecting this information, tables of product sizes, tooling sizes using convenient factors of draw down ratios, line speed calculations, etc. are compiled as in Table 6.1. From the tooling sizes a rough design of the die is made to get the geometry information for simulation purposes. From the simulation results, the design is corrected to suit the results and finalized to meet the customer requirements as close to the design brief as possible. This approach is repeated time and again for all the designs.

6.1.1 Design Brief

The information about the required die received from a particular customer is as shown in Table 6.1.

6.1.3 Design Procedure

Table 6.2 is used for starting the design from the tooling end and this information is used for the simulation as well. From the design brief in Table 6.1 it was evident that the output required by the customer is 45 kg/h (the maximum plasticizing...
capacity of the extruder). This level of output is used for the largest size of tooling and smaller sizes of the tube would have less output, because of the high shear stress in the land area of the die annulus. Table 6.3 shows that a 45 kg/h output for a tube size of 5.71 mm in outside diameter and 4.71 mm in inside diameter will give a line speed of 120 m/min, whereas a tube of 2.40 mm in outside diameter and 1.80 mm in inside diameter will give a line speed of 276 m/min. It must be checked with the customer if their equipment would be capable of handling such a high line speed. The draw down ratio, which determines the tooling size and the level of output, can be changed from the simulation results, when the performance of the whole die is optimized.

From the above information, a rough design of the die is made to establish the initial dimensions of the die geometry. This die geometry along with the material information and the processing conditions are inserted into the simulation software to get the simulation results. The results are then checked and the design is changed to optimize the processing results in terms of the pressure drop in the die, shear rate, shear stress, residence time, etc., so that the ultimate die design meets the customer expectations and gives the most suitable results. This exercise, as explained in the previous chapter, is completed for all the sizes of the tubes and specified materials to be processed. The final design of the die for this particular customer is shown in Figure 6.1 and Figure 6.2.

The die shown in Figure 6.1 and Figure 6.2 is based on the 2 mm tube tooling as specified in Table 6.2. The die is designed for precision medical tubes, where the tooling is semi-fixed center; in other words, the pin is inserted into a concentric mandrel and it fits tightly on the taper in the mandrel. The die has a very slight radial adjustment on the die carrier (08), as shown in Figure 6.1. The whole idea is that once the small radial adjustment to get an even wall thickness of the tube is made, then the die adjustment should be locked in place. Any further tool changes should be made without the necessity of any adjustment to get an even wall thickness of the products. As the pin is inserted in the mandrel from the front, removing the pin for tool changing would be difficult unless the whole die is dismantled.

To facilitate the quick tool changes, a pin pusher plug (12) and a pin pusher bolt (13) are placed in the die design. The winding in of the pin pusher bolt would push the pin pusher plug outward, which would release the pin from its taper in the mandrel. For inserting the new pin into the mandrel, the pin pusher bolt (13) is wound outward. For replacing the die, the die adjusting nut (09) in the front is removed first and then the die is pushed out with a slight movement of the melt from the extruder. In this way, a quick and easy tool changing is accomplished.
Figure 6.1  Sectional view of 2–6 mm tube dies, showing 2 mm pin and die in place and a mechanism for pushing the pin out

Figure 6.2  Sectional view of 2–6 mm tube dies, showing 2 mm pin and die in place and feed of melt into the spirals
Calculations of Draw Down Ratios for Tooling Sizes

The calculations of the inside diameters and wall thicknesses based on SDR 11, 17, and 26 and the sizes of the pins and dies using an adequate draw down ratio, along with the land length of the die, are given in Table 9.4.

| Table 9.4 Draw Down Ratios and Tooling Sizes |
|---------------------------------|---|---|---|---|---|---|---|---|---|---|---|
| Pipe spec. | OD [mm] | ID [mm] | Wall thickness [mm] | Die ID [mm] | Pin OD [mm] | DDR | Layer thickness at die exit [mm] | DRB | Die land length [mm] | Max. output [kg/h] |
| SDR 11  |
| 1 | 140 | 140.00 | 114.55 | 12.73 | 154.0 | 126.00 | 1.21 | 14.00 | 1.00 | 210 | 370 |
| 2 | 160 | 160.00 | 130.91 | 14.55 | 176.0 | 144.00 | 1.21 | 16.00 | 1.00 | 240 | 380 |
| 3 | 180 | 180.00 | 147.27 | 16.36 | 198.00 | 162.00 | 1.21 | 18.00 | 1.00 | 270 | 400 |
| 4 | 225 | 225.00 | 184.10 | 20.45 | 247.50 | 202.50 | 1.21 | 22.50 | 1.00 | 338 | 400 |
| SDR 17  |
| 5 | 140 | 140.00 | 123.53 | 8.24 | 168.00 | 148.24 | 1.44 | 9.88 | 1.00 | 148 | 340 |
| 6 | 160 | 160.00 | 141.18 | 9.41 | 192.00 | 169.41 | 1.44 | 11.29 | 1.00 | 169 | 360 |
| 7 | 180 | 180.00 | 158.82 | 10.59 | 216.00 | 190.59 | 1.44 | 12.71 | 1.00 | 191 | 380 |
| 8 | 225 | 225.00 | 198.53 | 13.24 | 270.00 | 238.24 | 1.44 | 15.88 | 1.00 | 238 | 400 |
| 9 | 250 | 250.00 | 220.59 | 14.71 | 300.00 | 264.71 | 1.44 | 17.65 | 1.00 | 265 | 420 |
| 10 | 280 | 280.00 | 247.06 | 16.47 | 336.00 | 296.47 | 1.44 | 19.76 | 1.00 | 296 | 430 |
| 11 | 315 | 315.00 | 277.94 | 18.53 | 378.0 | 333.53 | 1.44 | 22.24 | 1.00 | 334 | 450 |
Columns 1–10 in Table 9.4 are normal pre-design calculations; column 11 is the die land length, which in this case has been fixed as 15 times the layer thickness at the die exit. Column 12 is obtained from the die simulation results, which are explained later in the chapter.

### 9.3 Initial Die Design

From the sizes of die and pin given in Table 9.4, initially the die is designed for a ∅315 mm × 17 SDR pipe using the die inside diameter of 378.00 mm, the pin outside diameter of 333.53 mm, and the land length of 334.00 mm. The design of the complete die is shown in Figure 9.1. The design of the initial die is slightly different to the previous dies discussed above. In this case, the die mandrel has 8 spirals, whereas in the previous dies 4–6 spiral designs were used. This is due to the physical size of the die. For the same reason, the inside of the mandrel and the pin are hollowed out to reduce the weight of the die, and internal heaters are fitted for ease of heating up the die at the start of the operation and also for a better temperature control. In Figure 9.2, the same die is shown with the tooling for ∅140 mm × 17 SDR pipes.
Figure 9.1  G. A. of $\varnothing 315 \text{ mm} \times 17$ SDR die head

Figure 9.2  G. A. of $\varnothing 140 \text{ mm} \times 17$ SDR die head
10.2 Extruded Together from One Die

10.2.1.2 Pressure Drop

Pressure is a primary variable calculated during the solution. As has been seen in the previous examples of dies, pressure drops from the maximum at the start of the melt stream to zero at the die exit. As shown in Figure 10.12, the maximum average value of pressure at the beginning of the section is 0.108 MPa and 0.00 at the die exit.
Figure 10.13 shows a line through the outer section, along which the pressure drop of the outer layer is plotted in the graph in Figure 10.14. The total pressure drop through this section is 0.10232 MPa, which is the value at the beginning of the section on the right hand side, and it drops to zero at the die exit, as shown in the graph of pressure drop along the line in Figure 10.14.

Similarly, Figure 10.15 and Figure 10.16 show the pressure drop along the line in the inner layer. The value of pressure drop through this section is 0.10770 MPa. This is slightly higher than for the outer layer because of the narrow section near the junction of the two melts, and as this melt in the inner layer joins the main stream it equalizes to the outer layer, as shown in Figure 10.15.
10.2 Extruded Together from One Die

10.2.1.3 Temperature

Figure 10.17 shows the temperature variations in the section. The set temperatures for the two melts entering the die and the die body temperature are 200 °C. The blue areas in the section in Figure 10.17 are at 200 °C, and the yellow and red areas are at higher temperatures.
To investigate the extent of the variation in temperature near the wall of the outer layer, a line near the inside wall of the outer layer is drawn as shown in Figure 10.18, and the graph of temperature along this line is plotted in Figure 10.19. It can be seen from the graph that the temperature near the inside wall of the outer layer starts at 208 °C and rises to about 209 °C closer to where the two melt streams meet, and then it drops to 200 °C towards the die exit. For a material like HDPE this variation is not of much concern, since HDPE has a large window of processing temperature.

![Figure 10.19 Temperature profile along the line in Figure 10.18](image)

10.2.1.4 Shear Stress

The last variable to be checked for the die design is the shear stress. The physical meaning of this variable is that it shows the extent of shear stress generated during the melt flow. The value of shear stress is given in kPa. Figure 10.20 shows that the maximum shear stress is varying from −3.267 kPa to a maximum of 4.095 kPa in the red area of the section, which is in the die land region and closer to the outer
