Table of Contents

Part III: Project Management

Part IV: Managing Failures and Risks in Complex Systems

Part V: Modeling functions and functionality of complex systems

Part VI: Process and Change Management

Part VII: Systems' Architectures and Modularities

Foreword

Welcome you to the 17th annual International Dependency and Structure Modeling (DSM) Conference. The 2015 conference is hosted by the Neeley School of Business at Texas Christian University (TCU) in Fort Worth, Texas, USA, November 4-6. It is organized in collaboration with Technische Universität München (TUM).

This year's theme is "Modeling and Managing Complex Systems." Complex systems pervade our products, processes, organizations, projects, and environment. Modeling them can lead to valuable insights about their structure and behavior, which in turn can increase our understanding and capability to manage (or at least co-exist with) such systems.

The design structure matrix has proved useful for modeling, analyzing, visualizing, and understanding complex systems. Over the last 25 years in particular, DSM researchers, practitioners, and software developers have designed and enhanced many varieties of DSM methods, tools, and applications. That work continues at this conference and in these proceedings.

The International DSM Conference provides an annual forum for practitioners, researchers, and developers to exchange ideas and experiences and showcase results and tools. This year's conference begins with two parallel sessions the afternoon of November 4. The first of these is a DSM Industry Special Interest Group (DSMiSIG) meeting, where industry participants will discuss the challenges of complex systems in their particular arenas and opportunities for DSM models and tools to support improved engineering and managerial decisions. The second of these is an introductory tutorial for those new to design structure matrix methods and models.

Each of the papers submitted for this year's conference was peer-reviewed by at least two members of the Scientific Committee, who made acceptance/rejection recommendations and provided helpful guidance for revisions. The accepted papers appearing in these Proceedings have each been improved based on that feedback.

This volume contains 24 peer-reviewed papers that describe the recent advances and emerging challenges in DSM research and applications. They advance the DSM concepts and practice in seven areas:

1. DSM Methods and Complexity Management
2. Analyzing and Managing Organizations, Teams, and Individuals
3. Project Management
4. Managing Failures and Risks in Complex Systems
5. Modeling Functions and Functionality of Complex Systems
6. Process and Change Management
7. Systems' Architectures and Modularities

These Proceedings represent a broad overview of the state-of-the-art on the development and application of DSM. There are a significant number of papers with industry authors or co-authors, reflecting this balance and synergy between conceptual development and real-life industrial application, which are in the genes of the DSM Conference series.

The Program Chairs

Scientific Committee

Organizing Committee

Professor Tyson R. Browning, Texas Christian University, USA
Professor Steven D. Eppinger, Massachusetts Institute of Technology, USA
Danilo Marcello Schmidt, Technische Universität München, Germany
Jenya Felder, Texas Christian University, USA
Dr. Maik Maurer, Technische Universität München, Germany
Professor Udo Lindemann, Technische Universität München, Germany

Program Committee

All contributions in these proceedings have undergone a rigid review process. We would like to cordially thank all reviewers for their invaluable support.

Dr. Jason Bartolomei, U.S. Airforce, USA
Wieland Biedermann, DFG German Research Foundation, Germany
Professor Eric Bonjour, Université de Lorraine / ENSGSI, ERPI, France
Professor Tyson Browning, Texas Christian University, USA
Professor Mike Danilovic, Halmstad University, Sweden
Ramy El Behery, Shell Canada Ltd., Canada
Professor Steven D. Eppinger, Massachusetts Institute of Technology, USA
Dr. Romain Farel, École Central Paris, France
Dr. Marija Jankovic, École Centrale Paris, France
Professor Nitin Joglekar, Boston University, USA
Dr. Matthias Kreimeyer, MAN Nutzfahrzeuge Gruppe, Germany
Professor Andrew Kusiak, University of Iowa, USA
Professor Udo Lindemann, Technische Universität München, Germany
Professor Franck Marie, École Central Paris, France
Dr. Maik Maurer, Technische Universität München, Germany
Paschal Minogue, Analog Devices International, Ireland
Dr. Venkatachalam Senthilkumar, University of Witwatersrand Johannesburg, South Africa
Dr. Kaushik Sinha, Massachusetts Institute of Technology, USA
Harold A. (Mike) Stowe, The Boeing Company, USA
Professor Koshy Varghese, Indian Institute of Technology, USA
Dr. Daniel Whitney, Massachusetts Institute of Technology, USA
Dr. David Wynn, McGill University, Canada
Professor Ali Yassine, American University of Beirut, Lebanon

The International DSM Conference is an endorsed event of the Design Society.

Part I: DSM Methods and Complexity Management

17TH INTERNATIONAL DEPENDENCY AND STRUCTURE MODELING CONFERENCE, DSM 2015
FORT WORTH, TEXAS, USA, NOVEMBER 04 – 06, 2015

DSM Foundations and Applications, and an Update on the Explainer

Donald V. Steward

Problematics LLC, Napa, California, USA

Abstract: DSM can be used as an autonomous organization. It can also be used to manage risks. Frustrated and irrational people cannot solve problems, and when people cannot solve the problems that adversely affect them, they become frustrated and irrational. To escape this trap, it is necessary to solve the problems that got people into this trap. The Explainer can be used to extend people's limited capabilities to solve such complex problems. It can be used to find explanations for specific behaviors. And it can also be used to design systems to satisfy a given behavior by turning an explanation for the behavior into the design. Examples are shown for how the Explainer can be used to shed light on how to solve problems that befuddle Congress and cause such animosity and useless squabbles.

Keywords: Autonomous organizations, risk management, problem solving, frustration and irrationality traps

1 DSM as a new paradigm

In modern enterprises people must work together to solve problems. This problem solving process involves internal communications that go on within each head and external communications that go on between heads.

In the past, problems were generally solved by a reductionist approach that assumed that large problems could be broken down into smaller problems. This breakdown structure took the form of a tree. This has led to the familiar hierarchical organization.

But now DSM is a new paradigm that works from the structure of the information flow inherent in the problem (Steward, 1981a & 1981b). DSM has made it clear that the information flows required to solve many of today's complex problems don't have a simple tree structure. The DSM is a non-reductionist approach where the communications involve information flows that don't take a tree structure.

The reductionist approach assumes that a thing can be broken into parts and the parts broken into parts and so forth. It is based on interactions that occur by adjacency The DSM non-reductionist approach based on information flows involves assumptions and iterations to determine how things are put together.

2 DSM as an autonomous organization

It has been suggested by some that the organization be structured using the information structure revealed by the DSM. However, as the problem solving proceeds, we may learn more, causing our perception of that structure to change. And the problem itself may
